1 comments in latex export

This is some text that should appear normally. The next few lines are a comment which should not be exported. **Immediately** before this sentence is the appearance of **#+** which should not be there. I believe the regex requires a space after the plus sign but maybe a check for end of line **\$** as an alternative to a space could be used? I.e. something like `#\+\(|$\)` although I don't know if that type of expression will work...

2 problem exporting to latex with inline tasks

I often use inline tasks to help me organise my thoughts as I am writing long documents. However, exporting these no longer seems to work.

t why this doesn't work There are two problems with exporting inline tasks:

t why this doesn't work If the whole document is exported, the inline task headline text is inserted into the [] optional argument for an `\item`, generating something like this:

```
\item[@<span class="todo TODO"> TODO figure out why this doesn't work]
```

Further, this text in the [] appears in subsequent items as well! See the attached pdf document.

t why this doesn't work If only the current subtree is exported, the exported latex ends just before the inline task.

I believe both of these problems are related to the new list handling as I used to be able to export inline tasks perfectly fine in September.

3 version information

```
Org-mode version 7.02trans (release_7.3.5.g1197)
GNU Emacs 23.2.1 (i486-pc-linux-gnu, GTK+ Version 2.20.0)
of 2010-08-14 on raven, modified by Debian
```
